# Setting up your 4G Wireless Broadband router

## 1 Plug

Connect the black power adapter and turn your router on at the wall.

 Don't forget to attach the stand to the modem to keep it upright.

### TIP

Get the best mobile signal by putting your modem up high on a hard surface near a window, and away from electronics like microwaves and TVs.

## 2 Power

Wait 30-60 seconds for the lights on the modem to come on.

### TIP

Your modem will indicate how strong the signal is. To pick up the best signal, try moving it to different spots in your house.

## 3 Connect

Connect using the Wi-Fi name and password found on the back of your router.

**Boom. You're online. Easy.**

### TIP

In case you want to plug your modem directly into a computer, we've included a handy ethernet cable.
